

2. Codex Mobile — Control Your Entire Workspace From Your Phone

voice_reference: Youtube/Input/4. Resources/2.
scripting_resources/voice_reference/nate_herk_voice_reference.md —
sections 1, 5, 6, 8, 11, 16

Core Idea

OpenAI just released Codex Mobile — a new feature that lets you connect Codex directly to your phone and control your entire workspace from anywhere. The video opens with the big demo (publishing a YouTube video from a phone), then explains what Codex Mobile is, then shows a second demo (sending a client WhatsApp update announcing a tool change), then gives Daniel's quick take comparing it to Claude Code mobile access.

Hook Type

News drop + big demo lead

The One Thing

OpenAI's new Codex Mobile lets you run your entire workspace from your phone — and this matters for any business owner who uses AI agents.

Hook (under 30 words)

OpenAI just dropped something that lets you control your entire workspace from your phone — and I'm going to show you what that actually looks like.

Target Viewer

A business owner who has used ChatGPT or dabbled with AI coding agents, knows what LLMs are, but isn't deeply technical — they want to know whether this new OpenAI thing changes how they should be working.

Payoff

After watching, the viewer can open Codex Mobile, know what to use it for, and understand how it compares to Claude Code on mobile before deciding which to try.

Beat Structure

#	Beat	What Happens	Demo / Visual	~Words
1	Hook	“OpenAI just dropped Codex Mobile” — set up the big demo that’s coming	Phone + computer split screen or phone footage	80
2	Big Demo: Publish a YouTube video from my phone	Open Codex Mobile, give it the instruction to publish the video, watch it execute the full workflow from the phone	Live screen record of Codex Mobile executing the publish agent	200
3	What is Codex Mobile?	Quick explainer — what it is, how it connects, what it can access	App UI walkthrough	150
4	Demo 2: WhatsApp client update	Message a client to let them know a new tool (HyperFrames) just dropped that changes how their video editing workflow works — old system used Remotion, this changes the process, here’s what’s updating	Show dictating the message on phone → Codex sends it	150
5	“You can do this with Claude Code too — here’s the difference”	Brief opinion beat. Claude Code has Remote Control (Max plan) and SSH/Termux options, but requires setup. Codex Mobile is purpose-built for the phone — no terminal, no configuration, just open and go. Codex Mobile is for business owners who want to delegate; Claude Code	Side-by-side or talking head	120

#	Beat	What Happens	Demo / Visual	~Words
6	CTA	is for power users who want full control. If you want to know how to run Codex without burning through your token budget, that's the next video	Cut to title card	50

Demo Details

Demo 1 — Publish YouTube video from phone

- Use Codex Mobile to trigger the publishing workflow (set title, add thumbnail, upload/schedule the video)
- This is the big wow moment — the opening hook pays off here

Demo 2 — WhatsApp client update

- **Scenario:** A new tool (HyperFrames) just dropped that changes how videos are edited. The old workflow used Remotion. You're letting the client know their system is being upgraded and the workflow is changing.
- **On-screen framing for viewers:** Keep it jargon-light — “a new tool dropped that changes how we edit videos, so the workflow you're running needs to be updated”
- **Execution:** Dictate the message in Codex Mobile → Codex sends the WhatsApp live on screen

Comparison Beat — Research Notes (for scripting agent)

Claude Code mobile access status:

- **Remote Control** (official, Max plan): One-command handoff from desktop to phone — easiest setup, under 1 minute
- **SSH + Termux/Blink Shell:** Works for any device, keeps sessions alive, but requires Node.js, SSH keys, tmux — technical setup
- **Key difference from Codex Mobile:** Claude Code on mobile is an extension of a desktop tool; Codex Mobile is a native phone app designed to work without a computer present

Scripting note: Verify exact Codex Mobile feature details (standalone app vs. requires computer running in the background?) before writing this beat — the comparison only works if the actual architecture difference is correct.

Analogy Bank

1. **Remote control:** “It’s like having a remote control for your computer — except your computer is running AI agents while you’re anywhere.”
 2. **Text your assistant:** “Like texting a member of your team — you brief them from your phone, they do the work, they report back.”
-

Thesis Line Location

Beat 5 — “Codex Mobile is built for the phone; Claude Code is built for the desk. Right now, you might want both.”

Framework Phrase

Mobile workspace control

Specificity Bank

- Codex Mobile (exact feature/app name — verify before scripting)
 - OpenAI
 - HyperFrames (new tool, replaces Remotion for video editing)
 - Remotion (old tool being replaced)
 - WhatsApp
 - Claude Code Remote Control (Max plan)
 - Termux, Blink Shell (SSH alternatives for Claude Code)
-

Constraints

- Do NOT build a full agent walkthrough step-by-step
 - Do NOT cover Codex Mobile pricing or subscription tiers
 - Keep the Claude Code comparison to 30–45 seconds max — this is not a versus video
 - Frame the WhatsApp demo in plain language — not everyone knows HyperFrames or Remotion; explain it as “changes how we edit videos”
-

Personal Angle

[DANIEL TO FILL] — what was the first thing you did when you got Codex Mobile?

Vulnerability Moment

[DANIEL TO FILL] — a time you were away from your desk and couldn't act on something; how Codex Mobile changes that

CTA Direction

If you want to run Codex without burning through your token budget, the next video covers exactly that.
