PRODUCTION LEGEND

[Screen: ...] = visual cue — what's on screen at this moment | **TH** = Talking Head (face to camera, screen PIP unless noted) | **LIVE** = Live screen content — phone or desktop recording is primary visual
<slow> = slow down, let it land | <beat> = deliberate pause | <energy> = pick up the pace

TH BEAT 1 — HOOK

~60w

OpenAI just dropped Codex Mobile — and honestly, this thing is kind of insane. <beat> **[Screen: iPhone screen recording visible — face PIP]**

I'm going to show you an AI agent physically go into my Mac Mini, open YouTube, and schedule a video — description, timestamps, all of it — from my phone.

So in this video — I'll walk you through everything you need to know: how it works, how to set it up, and how to actually put it to work. <beat>

Alright — let's jump in.

LIVE BEAT 2 — WHAT IS CODEX MOBILE?

~155w

[Screen: Portrait slide presentation — Slide 2.1: "What is Codex Mobile?"]

Alright so — what actually is this thing.

[Screen: Slide 2.2 — Codex desktop app → QR code → ChatGPT mobile]

First — it's not a new app. You scan a QR code from your Codex desktop app where your workspace is set up, and it shows up right inside ChatGPT on your phone. That's it. You're connected.

[Screen: Slide 2.3 — real-time screenshots · terminal output · task results]

Once you're connected — everything happening on your desktop streams to your phone in real time. Screenshots, task results, outputs — it's all there.

[Screen: Slide 2.4 — messages · scheduling · agents · workflows · files]

And what can you get it to do — pretty much anything. Send messages from any app on your computer. Schedule YouTube videos. Run agents. Pull data. Open files, trigger workflows. As long as the app exists on your computer, Codex can get into it. From your phone.

[Screen: Slide 2.5 — "Your computer does the work. You direct it from your phone." — hold]

Okay, that sounds cool — but what makes this actually useful? <slow> Your computer is running. You're just not sitting at it. Your workflows don't need to wait on you for approval. Pull out your phone and handle it from wherever you are. You don't need to go back to your desk and find out a task has been waiting for you to approve it for the last 3 hours while you're at the gym.

↑ SLOW DOWN. This is the line.

[Screen: Hold on slide — let it breathe]

LIVE BEAT 3 — HOW TO SET IT UP

~95w

[Screen: Desktop screen recording — Codex app download page]

Alright — how to actually get this running.

One — download the Codex desktop app. You'll need to be on the Pro plan — that's the \$20 a month one. **[Screen: Codex app / Pro plan page]**

Two — set up your workspace inside Codex. Your agents, your workflows, the tasks you need to get done — all of that lives here. This is your setup. **[Screen: Workspace setup in Codex desktop]**

Three — in the app, find "Connect Codex Mobile." It brings up a QR code. Scan it with your phone camera and you're in. **[Screen: QR code on desktop — phone camera scanning]**

Four — grant the permissions when it asks. You don't have to give it access to everything. But you do have to give it enough — otherwise what's the point of setting all this up if it can't actually do anything? **[Screen: Permissions prompt]**

LIVE BEAT 4 — DEMO: YOUTUBE SCHEDULING

~110W

[Screen: iPhone screen recording — Codex Mobile open in ChatGPT]

So — I've got agents and API keys already set up for my YouTube workflow. Going to use my voice.

"Hey, can you tell me which videos are currently ready to be posted?"

[Screen: Codex responding — list of videos available to schedule]

You can see it pulled up a few options. I'm going to pick one. <beat> Before I post it — I want to check the description.

"Is the description ready? Can you give me a quick summary — the video description and timestamps?"

[Screen: Codex responding — description and timestamps displayed]

There we go. That looks right. <beat>

"Okay — go ahead and schedule this one for Friday at 4pm."

<beat> **[Screen: Codex executing — YouTube Studio loading — video showing as scheduled]**

There it is. Scheduled. <beat> Three voice prompts. I never touched the computer. **[Screen: Hold on YouTube Studio — scheduled video visible]**

TH BEAT 5 — PERSONAL ANGLE

~45W

[Screen: Face only — PIP off, clean shot]

First thing I did when I got this — I added something to my Amazon cart. <beat> First time, a bit slow. Asked it to do the same thing again — noticeably faster. It learns.

TH BEAT 6 — CLAUDE CODE COMPARISON

~80W · max 45 seconds

[Screen: Face + PIP]

Quick thing for anyone on Claude Code — you've got Remote Control on the Pro plan, and I'm going to have a dedicated video on that as well, so keep an eye out.

Either way — different tools, different things they do well. Codex Mobile only just dropped a few days ago, and I've been playing around with it a lot since then.

And honestly — the UI is really good. Like genuinely clean and intuitive. That matters when you're actually trying to set up workflows and deploy agents from a small screen. It's genuinely a tool worth having in your toolkit. **[Screen: Hold on face]**

TH BEAT 7 — CTA

~55w

[Screen: Face — clean, no PIP]

If you got something out of this, give it a like — it genuinely helps. Next video is Prompts Explained — if you want to know how to get exactly the answers you want out of your AI prompts, that's the one. And hit subscribe — the channel's just getting started and every subscriber actually makes a difference right now. See you in the next one.

VOICE CHECKLIST — verify before recording

- ☒ No warm-up intro — straight into hook
- ☒ "Alright so —" gear-change transitions (Beats 2, 3, 4)
- ☒ Second person present — "you can get it to do," "you're not sitting at it"
- ☒ Tech terms explained in same sentence: Codex Mobile = "scan a QR code from your Codex desktop app, shows up inside ChatGPT" · Remote Control = "Pro plan" flag
- ☒ No credential drop (tutorial video)
- ☒ Thesis line in Beat 2 — annotated with SLOW DOWN
- ☒ Voice prompts shown verbatim — Beat 4
- ☒ Personal angle used as bridge — Beat 5
- ☒ CTA: like → next video tease → subscribe — Beat 7
- ☒ No "Furthermore / However / In conclusion"

☑ Natural imperfections allowed throughout delivery

READ-THROUGH NOTES

- **Beat 1:** Come in sharp. Pause lands after "from my phone." — hold it a full beat before the promise. "Alright — let's jump in" is the gear change, not a preamble.
- **Beat 2:** Conceptual heart of the video. Let each slide appear before narrating it. The thesis line — "Your computer is running. You're just not sitting at it." — slow all the way down, pause before and after. The gym line should feel like a thought you just had, not a scripted example.
- **Beat 3:** Tutorial mode — cleaner, slightly more deliberate. Read each step clearly. "Scan it with your phone camera and you're in" is the moment of payoff, let it land.
- **Beat 4:** Go quiet while Codex executes each prompt. The silence while it runs is part of the demo. Only speak once the result is on screen. "Three voice prompts. I never touched the computer." — understated, don't play it up.
- **Beat 5:** Light and quick. Slight smile on the Amazon cart moment. "It learns." — that's the line, let it land before moving on.
- **Beat 6:** Casual aside, not a pivot. The Remote Control mention is a quick flag. The UI observation at the end should feel like a genuine offhand thought.
- **Beat 7:** Warm, not performative. "Every subscriber makes a difference" is honest — deliver it that way.
